

SAN LUCAS ZONE

Approximate Southwestern Margin of Deep-Seated Melchor Ocampo Stock (Interpreted - Very Schematic)

Note strong magnetic response with excellent correlation with hornfelsed sediments and subvolcanics - strong low magnetic "undershoots" surrounding high indicates magnetic source likely has limited depth extent

JULIA ZONE

Monzonite/Latite Subvolcanics (Pyrite-Rich)

Hornfelsed Sediments

Shallow, Steeply Dipping Linear Magnetic Features - Intercalated Flows in Caracol Fm.? - Dikes?? - Source not Shown in Mapping but Conforms with Mapped Caracol Strike

LAS CRUCITAS

Linear, Shallow, Steeply Dipping Magnetic Features in Alluvium - Flow/Dike in Caracol Fm.? (man-made magnetic "cult")

Weak Magnetic High Shallow Source - Under Alluvium

Possible NW Extension of Granodiorite at Shallow Depth

Granodiorite (Gd)

Linear, Steeply-Dipping, Shallow-Source Weak Highs in Caracol Fm.? Flows/Dikes?

SOUTHWEST ZONE

Approximate Northern Margin of Deep-Seated Component of Noche Buena Stock (Interpreted - Very Schematic)
